

STERNTUBE SEAL SERVICE

We offer a comprehensive service from engine to the propeller, including full overhaul of propeller hubs, bow thrusters, shaft couplings and stern tube seals. Our team of experienced engineers is dedicated to the maintenance and repair of a wide range of stern tube seals on a worldwide basis.

Original spares, correct tolerances

Not only is all work carried out fully guaranteed, but, even more importantly, you can be sure that your seals are reassembled with original spares in full accordance with manufacturers' tolerances.

Computerised records, advice for future docking

At the end of every job a report is given to the customer, listing full details of work carried out and the condition of the seal, together with any recommendations for the future. All reports are added to our database and can be referred to for future planning or maintenance schedules.

Time required to replace seals

Depending upon the circumstances found on site, our engineers will typically require three days to complete standard or straightforward repairs including bonding.

Our engineers liaise closely with superintendents and the shipyard in order to ensure the work is carried out as quickly as possible.

Class approved bonding of seals in situ

It is possible to replace the sealing rings without pulling the shaft by cutting off the old sealing rings and then vulcanising the new sealing rings using a specialist bonding device and a patented two-component adhesive. This bonding procedure is approved by class as a permanent repair.

Guarantee

all work is guaranteed for six months

Insurance

£5m product liability insurance
